Cylinder with Lock

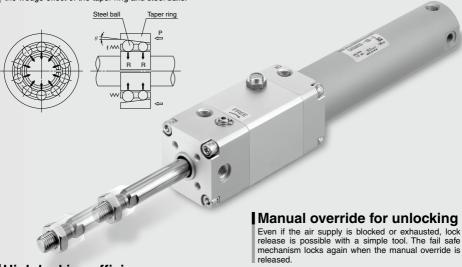

CNG Series

Ø20, Ø25, Ø32, Ø40

A locking cylinder ideal for intermediate stops, emergency stops and drop prevention.

Simple construction

A force magnifying mechanism is employed based on the wedge effect of the taper ring and steel balls.

High locking efficiency

Greater locking efficiency as well as stable locking and unlocking operation has been achieved by arranging a large number of steel ball bearings in circular rows. (Unlocking pressure of 0.25 MPa 0.05 MPa lower than conventional SMC products) In addition, both alignability and stable locking force with respect to piston rod eccentricity are obtained by allowing the taper ring to

Design minimizes the influences of unlocking air quality

A construction which is strong against moisture and drainage in the compressed air has been realized by separating the locking mechanism and the unlocking chamber

High reliability and stable holding force

Outstanding durability and stable holding force are maintained by the use of a brake shoe having superior wear resistance, which has also been substantially lengthened (double the conventional SMC product).

CNG Series Model Selection

Precautions on Model Selection

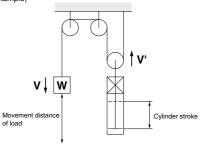

⚠ Caution

 In order that the originally selected maximum speed is not exceeded, be certain to use a speed controller to adjust the total movement distance of the load so that movement takes place in no less than the applicable movement time.

The movement time is the time that is necessary for the load to travel the total movement distance from the start without any intermediate stops.

In cases where the cylinder stroke and the movement distance of the load are different (double speed mechanism, etc.), use the movement distance of the load for selection purposes.

Example)

3. The following selection example and procedures are based on use at the intermediate stop (including emergency stops during operation). However, when the cylinder is in a locked state, kinetic energy does not act upon it. Under these conditions, use the load mass at the maximum speed (V) of 100 mm/s shown in graphs (5) to (7) depending on the operating pressure and select models.

Selection Example

• Load mass: m = 12 kg • Movement distance: st = 200 mm • Movement time: t = 0.8 s

 Load condition: Vertical downward = Load in direction of rod extension

• Operating pressure: **P** = 0.4 MPa

Step (1): From graph (1) find the maximum movement speed of the load.

∴ Maximum speed V § 350 mm/s

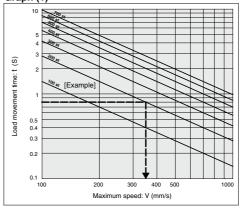

Step (2): Select graph (6) based upon the load condition and operating pressure, and then from the intersection of the maximum speed V = 350 mm/s found in Step (1), and the load mass m = 12 kg

∴ø32 → select a CNG32 or larger bore size.

Step (1) Find the maximum load speed V.

Find the maximum load speed: V (mm/s) from the load movement time: t (s) and the movement distance: st (mm).

Graph (1)

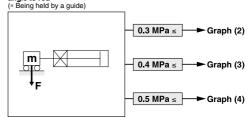

Step (2) Find the bore size.

Select a graph based upon the load condition and operating pressure, and then find the point of intersection for the maximum speed found in Step (1) and the load mass. Select the bore size on the above the point of intersection.

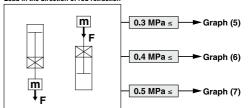

Load Condition

Operating Pressure

Load in the direction at the right angle to rod

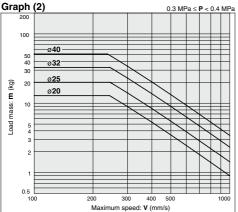

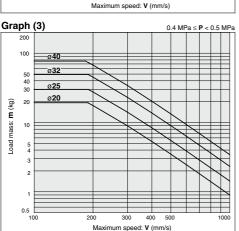

Load in the direction of rod extension Load in the direction of rod retraction

Calculation: (Example) CNGLA20-100-D (Foot type, ø20, 100 st)

 $0.63 + 0.05 \times 100/50 + 0.01 = 0.74 \text{ kg}$

Construction Principle

Spring locking (Exhaust locking)

The spring force which acts upon the taper ring is magnified by a wedge effect, and is conveyed to all of the numerous steel balls which are arranged in two circles. These act on the brake shoe holder and brake, which locks the piston rod by tightening against it with a large force.

Unlocking is accomplished when air pressure is supplied to the unlocking port. The release piston and taper ring oppose the spring force, moving to the right side, and the ball retainer strikes the cover section. The braking force is released as the steel balls are removed from the taper ring by the ball retainer.

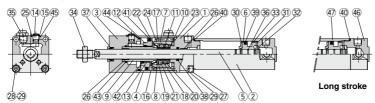

^{*} For details about part numbers and dimensions, refer to page 878. (For rod boots, refer to page 870.)

Note 1) Since the switch bracket (made from nylon) are affected in an environment where alcohol, chloroform, methylamines, hydrochloric acid or sulfuric acid is splashed over, so it cannot be used. Please consult SMC regarding other chemicals.

Note 2) When mounting a D-M9□A(V) type auto switch, if the switch bracket is mounted on the indicator light, it may damage the auto switch. Therefore, be sure to avoid mounting the switch bracket on the indicator light.

[Mounting screw set made of stainless steel]

The following set of mounting screws made of stainless steel is available. Use it in accordance with the operating environment.

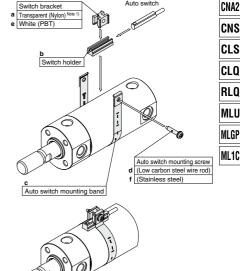

(Please order the auto switch mounting bracket separately, since it is not included.) BBA3: D-B5,B6,G5,K5 types

BBA4: D-C7,C80,H7 types

Note) Refer to page 1225 for details on the BBA3.

The above stainless steel screws are used when a cylinder is shipped with the D-H7BA/G5BA auto switch.

When only an auto switch is shipped independently, the BBA3 or BBA4 is

Auto switch

(With switch installed) * Band (c) is mounted so that the projected part is on the internal side (contact side with the tube).

| Solid state | D-H7NW, H7PW, H7BW | | Diagnostic indication (2-color) |
| | D-G5NT | | With timer |

^{*} For solid state auto switches, auto switches with a pre-wired connector are also available. Refer to pages 1192 and 1193 for details.

* Normally closed (NC = b contact) solid state auto switches (D-M9□E(V)) are also available. Refer to page 1592-1 for details.

Be sure to read this before handling the products.

Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

Design of Equipment and Machinery

⚠ Warning

Construct so that the human body will not come into direct contact with driven objects or the moving parts of locking cylinders.

Devise a safe structure by attaching protective covers that prevent direct contact with the human body, or in cases where there is a danger of contact, provide sensors or other devices to perform an emergency stop, etc., before contact occurs.

2. Use a balance circuit, taking cylinder lurching into consideration.

In cases such as an intermediate stop, where a lock is operated at a desired position within the stroke and air pressure is applied from only one side of the cylinder, the piston will lurch at high speed when the lock is released. In such situations, there is a danger of causing human injury by having hands or feet, etc. caught, and also a danger for causing damage to the equipment. In order to prevent this lurching, a balance circuit such as the recommended pneumatic circuits (pages 884 and 885) should be used.

Selection

\land Warning

 When in the locked state, do not apply a load accompanied by an impact shock, strong vibration or turning force, etc.

Use caution, because an external action such as an impacting load, strong vibration or turning force, may damage the locking mechanism or reduce its life.

Consider stopping accuracy and the amount of overrun when an intermediate stop is performed.

Due to the nature of a mechanical lock, there is a momentary lag with respect to the stop signal, and a time delay occurs before stopping. The cylinder stroke resulting from this delay is the overrun amount. The difference between the maximum and minimum overrun amounts is the stopping accuracy.

- Place a limit switch before the desired stopping position, at a distance equal to the overrun amount.
- The limit switch must have a detection length (dog length) of the overrun amount + α.
- For SMC's auto switches, the operating range is between 8 and 14 mm. (It varies depending on a switch model.) When the overrun amount exceeds this range, selfholding of the contact should be performed at the switch load side.
 - * For stopping accuracy, refer to page 867.

Selection

⚠ Warning

In order to further improve stopping accuracy, the time from the stop signal to the operation of the lock should be shortened as much as possible.

To accomplish this, use a device such as a highly responsive electric control circuit or solenoid valve driven by direct current, and place the solenoid valve as close as possible to the cylinder.

4. Note that the stopping accuracy will be influenced by changes in piston speed.

When piston speed changes during the course of the cylinder stroke due to variations in the load or disturbances, etc., the dispersion of stopping positions will increase. Therefore, consideration should be given to establishing a standard speed for the piston just before it reaches the stopping position. Moreover, the dispersion of stopping positions will increase during the cushioned portion of the stroke and during the accelerating portion of the stroke after the start of operation, due to the large changes in piston speed.

The holding force (max. static load) indicates the maximum capability to hold a static load without loads, vibration and impact. This does not indicate a load that can be held in ordinary conditions.

Select the most suitable bore sizes for the operating conditions in accordance with the selection procedures. The Model Selection (pages 864 and 865) is based on use at the intermediate stop (including emergency stops during operation). However, when the cylinder is in a locked state, kinetic energy does not act upon it. Under these conditions, use the load mass at the maximum speed (V) of 100 mm/s shown in graphs (5) to (7) on page 865 depending on the operating pressure and select models.

Mounting

⚠ Warning

 Be certain to connect the rod end to the load with the lock released.

If connected in the locked state, a load greater than the turning force or holding force may operate on the piston rod and cause damage to the lock mechanism. The CNG series is equipped with an emergency unlocking mechanism, however, when connecting the rod end to the load this should be done with the lock released by simply connecting an air line to the unlocking port and supplying airpressure of 0.25 MPa or more.

2. When the cylinder is used as mounted with a single side fixed or free (basic type, flange type), a bending moment will be applied to the cylinder due to the vibration generated at the stroke end, and the cylinder may be damaged. In such a case, mount a bracket to reduce the vibration of the cylinder or use the cylinder at a piston speed low enough to prevent the cylinder from vibrating at the stroke end.

Also, please use a support bracket when the cylinder body moves or when the long stroke cylinder is fixed horizontally on one side.

1. Install a rod boot without twisting.

If the cylinder is installed with its bellows twisted, it could damage the bellows.

2. Tighten clevis bracket mounting bolts with the following proper tightening torque.

ø20: 1.5 N·m, ø25 to 32: 2.9 N·m, ø40: 4.9 N·m, ø50: 11.8 N·m, ø63 to 80: 24.5 N·m, ø100: 42.2 N·m D-□ -X□

Be sure to read this before handling the products.

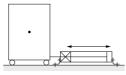

Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

Mounting

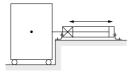

⚠ Caution

1. Do not apply offset loads to the piston rod.

Particular care should be taken to match the load's center of gravity with the center of the cylinder shaft. When there is a large discrepancy, the piston rod may be subjected to uneven wear or damage due to the inertial moment during locking stops.

X Load center of gravity and cylinder shaft center are not matched.

O Load center of gravity and cylinder shaft center are matched.

Note) Can be used if all of the generated moment is absorbed by an effective quide.

Adjustment

\land Warning

 Do not operate the cushion valve in the fully closed or fully opened state.

Using it in the fully closed state will cause the cushion seal to be damaged. Using it in the fully opened state will cause the piston rod assembly or the cover to be damaged.

- Operate within the specified cylinder speed. Otherwise, cylinder and seal damage may occur.
- 3. Carefully check the cushion performance in a low speed range.

The performance and effect at around 50 mm/s may vary depending on the individual difference of each product.

- 1. Adjust the cylinder's air balance. Balance the load by adjusting the air pressure in the rod and head sides of the cylinder with the load connected to the cylinder and the lock released. Lurching of the cylinder when unlocked can be prevented by carefully adjusting this air balance.
- 2. Adjust mounting position for detection area of auto switch etc. When intermediate stop is done, adjust the mounting position for detection stop is done, adjust the mounting position for detection area of auto switch etc., with consideration of over-run distance to required stop position.

Pneumatic Circuit

⚠ Warning

- 1. Be certain to use an pneumatic circuit which will apply balancing pressure to both sides of the piston when in a locked stop. In order to prevent cylinder lurching after a lock stop, when restarting or when manually unlocking, a circuit should be used to which will apply balancing pressure to both sides of the piston, thereby canceling the force generated by the load in the direction of piston movement.
- 2. The effective area of the unlocking solenoid valve should be at least 50% of the effective area of the cylinder driving solenoid valve, and it should be installed as close to the cylinder as possible so that it is closer than the cylinder driving solenoid valve. If the effective area of the unlocking solenoid valve is small or if it is installed at a distance from the cylinder, the time required for exhausting air for unlocking will be longer, which may cause a delay in the locking operation. The delay in the locking operation may result in problems such as increase of overrunning when performing intermediate stop or emergency stop during operation, or if maintaining position from the operation stop state such as drop prevention, workpieces may be dropped depending on the timing of the load action to the operation delay of the lock.
- Avoid backflow of the exhaust pressure when there is a possibility of interference
 of exhaust air, for example for a common exhaust type valve manifold.

The lock may not operate properly when the exhaust air pressure backflows due to interference of the exhaust air when exhausting air for lock release. It is recommended to use an individual exhaust type manifold or individual valves.

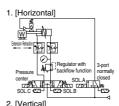

4. Allow at least 0.5 seconds from a locked stop (intermediate stop of the cylinder) until release of the lock.

When the locked stop time is too short, the piston rod (and load) may lurch at a speed greater than the control speed of the speed controller.

- 5. When restarting, control the switching signal for the unlocking solenoid valve so that it acts before or at the same time as the cylinder drive solenoid valve. If the signal is delayed, the piston rod (and load) may lurch at a speed greater than the control speed of the speed controller.
- 6. Carefully check for dew condensation due to repeated air supply and exhaust of the locking solenoid valve. The operating stoke of the lock part is very small. So, if the piping is long and the air supply and exhaust are repeated, the dew condensation caused by the adiabatic expansion accumulates in

the lock part. This may corrode internal parts, causing air leak or lock release fault.

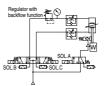

7. Basic circuit

z. [vertical]

[Load in the direction of rod extension]

 The symbol for the cylinder with lock in the basic circuit uses SMC original symbol.

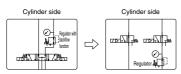

Be sure to read this before handling the products.

Refer to back page 50 for Safety Instructions and pages 3 to 12 for Actuator and Auto Switch Precautions.

Pneumatic Circuit

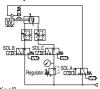

⚠ Caution

 3-position pressure center solenoid valve and regulator with backflow function can be replaced with two 3-port normally open valves and a regulator with relief function.

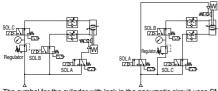

[Example]

1. [Horizontal]

[Vertical]
[Load in the direction of rod extension]

[Load in the direction of rod retraction]

 The symbol for the cylinder with lock in the pneumatic circuit uses SMC original symbol.

Manually Unlocking

⚠ Warning

- 1. Never operate the unlocking cam until safety has been confirmed. (Do not turn to the FREE side.)
 - a) When unlocking is performed with air pressure applied to only one side of the cylinder, the moving parts of the cylinder will lurch at high speed causing a serious hazard.
 - b) When unlocking is performed, be sure to confirm that personnel are not within the load movement range and that no other problems will occur if the load moves.
- 2. Before operating the unlocking cam, exhaust any residual pressure which is in the system.
- Take measures to prevent the load from dropping when unlocking is performed.
 - a) Perform work with the load in its lowest position.
 - b) Take measures for drop prevention by strut, etc.

∕ Caution

 The unlocking cam is an emergency unlocking mechanism only.

During an emergency when the air supply is stopped or cut off, this is used to alleviate a problem by forcibly pushing back the release piston and brake spring to release the lock.

- When installing the cylinder into equipment or performing adjustments, etc., be sure to apply air pressure of 0.25 MPa or more to the unlocking port, and do not perform work using the unlocking cam.
- When releasing the lock with the unlocking cam, it must be noted that the internal resistance of the cylinder will be high, unlike normally unlocking with air pressure.

| Bore size (mm) | Cylinder internal resistance (N) | Cam operating torque (standard) (N·m) | Max. cam operating torque (N·m) | Applicable hex. wrench size |
|-------------------|----------------------------------|---|---------------------------------|--------------------------------|
| 20 | 24.6 | 1.0 | 2.3 | Size 3 |
| 25 | 38.2 | 2.5 | 4.7 | Size 3 |
| 32 | 62.7 | 3.0 | 4.7 | Size 3 |
| 40 | 98 | 4.0 | 8.2 | Size 4 |

- 4. Be sure to operate the unlocking cam on the FREE side (clockwise direction), and do not turn with a torque greater than the maximum cam operating torque. There is a danger of damaging the unlocking cam if it is turned excessively.
- For safety reasons, the unlocking cam is constructed so that it cannot be fixed in the unlocked condition.

Locked state [Principle]

If the unlooking cam is turned in a clockwise direction with a hexagon wrench, the release piston is pushed back and the lock is released. Further, if the unlocking cam is not held it will return to its original position and the unit will lock again. Therefore, the unlocking cam must be held in position for as long as unlocking is required.

Maintenance

⚠ Caution

1. The CNG series lock units are replaceable.

(However, please note that lock units cannot be replaced in the case of long stroke specifications.)

To order replacement lock units for the CNG series, use the order numbers given in the table below.

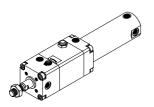

| Bore size (mm) | Lock unit part no. | | |
|-------------------|--------------------|------------------|--|
| Bore Size (IIIII) | Rubber bumper type | Air cushion type | |
| 20 | CNGN20D-UA | CNGA20D-UA | |
| 25 | CNGN25D-UA | CNGA25D-UA | |
| 32 | CNGN32D-UA | CNGA32D-UA | |
| 40 | CNGN40D-UA | CNGA40D-UA | |

2. Replacement of lock units.

 Remove the lock unit by securing the square section of the rod cover or the wrench flats of the tube cover in an apparatus such as a vice, and then loosening the other end with a spanner or adjustable angle wrench, etc.

For the dimensions of the square section and the wrench flats, refer to the table below.

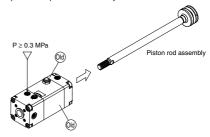

| Bore size (mm) | Rod cover square section (mm) | Tube cover wrench flats (mm) |
|----------------|-------------------------------|------------------------------|
| 20 | 38 | 24 |
| 25 | 45 | 29 |
| 32 | 45 | 35.5 |
| 40 | 52 | 44 |

2) Remove the tube cover.

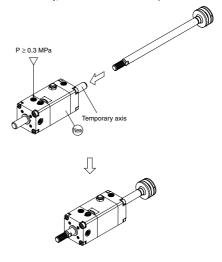

Apply 0.3 MPa or more of compressed air to the unlocking port, and pull out the piston rod assembly.

4) Similarly, apply 0.3 MPa or more of compressed air to the unlocking port of the new lock unit, and replace the new lock unit's temporary axis with the previous piston rod assembly.

Note) Be sure to keep applying compressed air with a pressure of at least 0.3 MPa to the lock releasing port when replacing the temporary axis of a new lock unit and a piston rod assembly.

If the compressed air applied to the unlocking port is released (when it is in the lock condition) while the temporary axis and the piston rod assembly are removed from the lock unit, the brake shoe will be deformed and it will become impossible to insert the piston rod assembly, which will make the lock unit impossible to use.

5) Reassemble in reverse order from steps 2) and 1). When retightening the sections, turn approximately 2° past their position prior to disassembly.
