High Speed 2 Port Valve SX10 Series

Variations/Purpose of Usage (Guide)

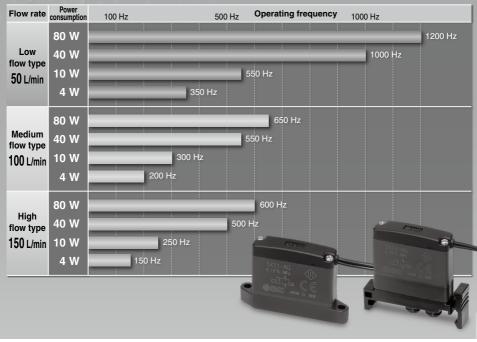

Specifications	Driver	Continuous	Power	OFF response time			
	Driver	energization	consumption	50 L/min	100 L/min	150 L/min	
Ultra high frequency type 500 to 1200 Hz	For power saving driver (Refer to page 511.)	-	80 W, 40 W	0.4 ms	0.55 ms	0.75 ms	
High frequency type 250 to 550 Hz	Control driver is not necessary.	(Note)	10 W	0.4 ms	0.55 ms	0.75 ms	
3 Super energy-saving type 150 to 350 Hz	Control driver is not necessary.	Possible	4 W	0.4 ms	0.55 ms	0.75 ms	

(Note) Please consult with SMC for continuous energization.

O Variations

All models have the same body size.

Note 1) 24 VDC, Duty ratio 1:1

80 W: Current needs to be limited by using an energy saving driver circuit.

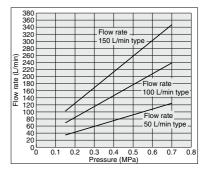

40 W: Current needs to be limited by using an energy saving driver circuit.

10 W: Energizing time is one second at a maximum. Please consult with SMC for continuous energization.

4 W: Continuous energization is possible.

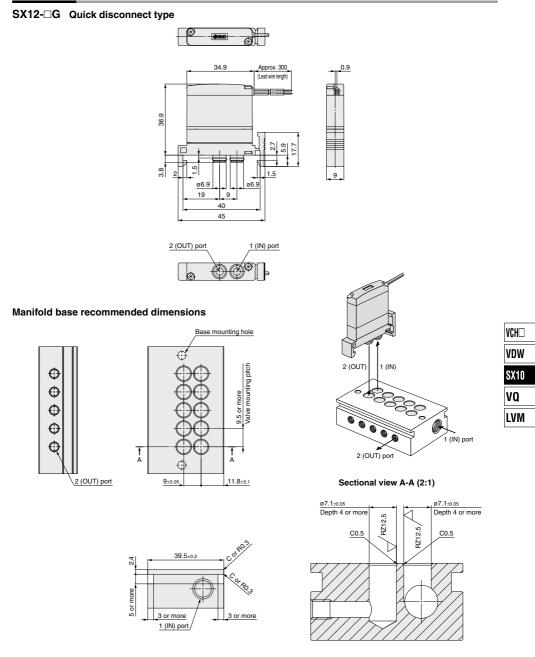

Note 2) The response time and maximum operating frequency are not guaranteed. (Actual values based on SMC test conditions)

Dimensions

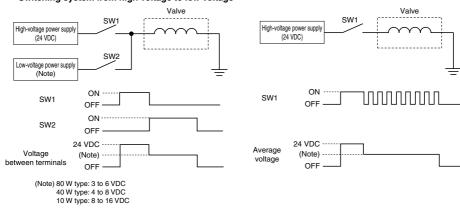

SX10 Series

Dimensions

Control Method (Operation example with an energy saving driver circuit)

- 1. Control with 2 power supplies, starting power supply and holding power supply. Switching system from high voltage to low voltage
- 2. High speed switching control of high voltage by PWM control*. (*: PWM control circuit not currently available.)

Specific Product Precautions

- Be sure to read this before handling the products.
- Refer to back page 50 for Safety Instructions and pages 17 to 19 for 2 Port Solenoid Valve for Fluid Control Precautions.

Continuous Energization (at 24 VDC)

\land Caution

1. Power consumption 80 W type: Not available

When operating with an energy saving driver, continuous energization with the holding voltage of 3 to 6 VDC is possible.

2. Power consumption 40 W type: Not available

When operating with an energy saving driver, continuous energization with the holding voltage of 4 to 8 VDC is possible.

3. Power consumption 10 W type: Please consult with SMC.

When operating with an energy saving driver, continuous energization with the holding voltage of 8 to 16 VDC is possible.

4. Power consumption 4 W type: Available

Energized Time/Non-energized Time (When not using power saving driver)

\land Caution

A Caution

- 1. Non-energized time (OFF) must be set longer than the energized time (ON).
- 2. For use with voltages other than 24 VDC, please LVM consult with SMC with the operating condition information of pressure, voltage, energized time and non-energized time.

Others

- 1. If the valve is energized without air supply, the coil may be burned. Make sure to supply pressure to the valve when energizing.
- Please contact SMC for the product usage with a voltage at 75 VDC or more. Standard required by CE/ UKCA mark is different.
- Since this valve is air return (differential pressure return) type, the valve may not close due to back pressure when the flow on the downstream side is restricted extremely.
- 4. Since this valve is air return (differential pressure return) type, the air is discharged to the OUT side momentarily until the valve returns when the IN side is pressurized. Be careful when pressurizing the valve.
